

## RODADEACO

## Diesel Engine Air Cutoff Valve

---

### The solution

The most effective way to shut down a runaway diesel engine is with a positive air intake shutoff valve. Simply turning off the ignition will not cut off the vapors from the air intake system, and the engine will continue to run out of control.

Roda Deaco automatic positive air shutoff valves are available in electrical or pneumatic actuation, and meet the requirements of CSA Regulation B622-14. They are designed to fit engines from major manufacturers including:

- › Peterbilt Trucks
- › Kenworth Trucks
- › International Trucks
- › Freightliner Trucks
- › Western Star Trucks

To make valve selection and installation easy, Roda Deaco has developed complete systems that have everything you need—air shutoff valve, sensors, speed switches, and accessories—all in one kit.
